Received and published: 29 July 2015

Good day,

We would firstly like to thank the reviewer #1 for pointing out some relevant issues.

Most notably, he asks for a longer spin-up run and a further inclusion of Croatian and Italian rivers into hydrological boundary conditions. We find these requests sensible and we are already working to implement them. Since longer spin-up, repetition of simulations and repetition of analysis will take some time, I decided to personally respond in this short note to notify the editor and the reviewers of our ongoing efforts.

C474

We will, needless to say, be specifically addressing all other remarks from reviewer #1 in a separate Author comment, which will follow after the new simulations (with longer spin-up and new riverine input inclusion) had been performed.

Until then, best regards,

Matjaž Ličer
