Page 501, lines 11 and 12 state:
"temperature and pressure within the equilibrator need to be measured to within ±0.1 C and ±1 mbar, respectively"

Neither of these stated accuracies are adequate. At 400 ppm a temperature error of 0.1 C gives an error of 1.7 ppm in CO2. An error of 1 mbar in equilibrator pressure gives an error of 0.4 ppm in CO2. I would suggest that temperature should be measured to 0.01 C and pressure to 0.2 mbar.
